MATHEMATICS

AP Calculus
Unit 4: Definite Integrals & Differential Equations
Course Philosophy/Description

AP Calculus AB is a course in single-variable calculus that includes techniques and applications of the derivative, techniques and applications of the definite integral, and the Fundamental Theorem of Calculus. It is equivalent to at least a semester of calculus at most colleges and universities, perhaps to a year of calculus at some. Algebraic, numerical, and graphical representations are emphasized throughout the course.

By the end of the course students will have learned Limits and Continuity; the Fundamental Theorems of Calculus; Definition of the Derivative of a Function and Techniques of Differentiation; Applications of the Derivative to maximize or minimize a function; the Chain Rule, Mean Value Theorem; Rate of Change problems; Curve Sketching; Definite and Indefinite integration of algebraic, trigonometric, and transcendental functions.

The connections between numerical, graphical, analytical, and verbal communication of Calculus topics are a major theme in the class along with the overall conceptual understanding of the Calculus topics covered. The use of technology reinforces these approaches to confirm and interpret the results. Calculus is a transition course linking the mathematical and algebraic procedures taught in previous classes with the higher-level skills required in post-secondary technical programs.

PREREQUISITES:

Before studying Calculus, all students must successfully complete coursework for Algebra I, Geometry, Algebra II, and Pre-Calculus. Students must be familiar with the properties, the algebra, the graphs and the language of functions. Attitude prerequisites include a willingness to work both in and out of class, a willingness to collaborate with classmates to foster mutual understanding, and a sincere intent to place out of the first semester of college calculus rather than repeat it.
**ESL Framework**

This ESL framework was designed to be used by bilingual, dual language, ESL and general education teachers. Bilingual and dual language programs use the home language and a second language for instruction. ESL teachers and general education or bilingual teachers may use this document to collaborate on unit and lesson planning to decide who will address certain components of the SLO and language objective. ESL teachers may use the appropriate leveled language objective to build lessons for ELLs which reflects what is covered in the general education program. In this way, whether it is a pull-out or push-in model, all teachers are working on the same Student Learning Objective connected to the Common Core standard. The design of language objectives are based on the alignment of the World-Class Instructional Design Assessment (WIDA) Consortium’s English Language Development (ELD) standards with the Common Core State Standards (NJSLS). WIDA’s ELD standards advance academic language development across content areas ultimately leading to academic achievement for English learners. As English learners are progressing through the six developmental linguistic stages, this framework will assist all teachers who work with English learners to appropriately identify the language needed to meet the requirements of the content standard. At the same time, the language objectives recognize the cognitive demand required to complete educational tasks. Even though listening and reading (receptive) skills differ from speaking and writing (expressive) skills across proficiency levels the cognitive function should not be diminished. For example, an Entering Level One student only has the linguistic ability to respond in single words in English with significant support from their home language. However, they could complete a Venn diagram with single words which demonstrates that they understand how the elements compare and contrast with each other or they could respond with the support of their home language (L1) with assistance from a teacher, para-professional, peer or a technology program.

| 1  | • Approximate the area under the graph of nonnegative continuous functions by using rectangle approximation method  
    • Interpret the area under the graph as a net accumulation of rate of change  
    • Express the area under the curve as a definite integral and as a limit of Riemann Sum  
    • Compute the area under a curve using a numerical integration procedure  
    • Apply rules of definite integrals and find the average value of a function over a closed interval | F-IF.A.1  
    F-IF.A.2  
    F.IF.A.3  
    F-IF.C.9 | 4.1, 4.2, 4.3 |
| 2  | • Apply the Fundamental Theorem of Calculus  
    • Understand the relationship between the derivative and definite integral as expressed in both parts of the Fundamental Theorem of Calculus  
    • Approximate the definite integral by using the Trapezoidal Rule and by using Simpson Rule  
    • Construct antiderivatives using the Fundamental Theorem of Calculus  
    • Construct slope fields using technology and interpret slope fields as visualizations of different equations.  
    • Use Eulers’s Method for graphing a solution to an initial value problem | F-IF.A.1  
    F-IF.A.2  
    F.IF.A.3  
    F-IF.C.9 | 4.3, 4.4, 5.1, 5.2, 5.3, 5.4 |
| 3  | • Compute indefinite and definite integrals by the method of substitution  
    • Use tabular integration or the method solving for the unknown integral in order to evaluate integrals that require repeated use of integration by parts  
    • Use integration by parts to evaluate indefinite and definite integrals  
    • Use integration by parts to integrate inverse trigonometric and logarithm functions | F-IF.A.1  
    F-IF.A.2  
    F.IF.A.3  
    F-IF.C.9 | 4.5, 4.6, 4.7, 7.1, 7.2, 7.3 |
| 4  | • Use integration to calculate the areas of regions in a plane  
    • Use integration (by slices or shells) to calculate volumes of solids  
    • Use integration to calculate surface areas of solids of a revolution | G.C.B.5  
    G.GMD.B.4  
    G.MG.A.3 | 6.1, 6.2, 6.3, 6.4 |
Research about Teaching and Learning Mathematics

Structure teaching of mathematical concepts and skills around problems to be solved (Checkly, 1997; Wood & Sellars, 1996; Wood & Sellars, 1997)
Encourage students to work cooperatively with others (Johnson & Johnson, 1975; Davidson, 1990)
Use group problem-solving to stimulate students to apply their mathematical thinking skills (Artzt & Armour-Thomas, 1992)
Students interact in ways that support and challenge one another’s strategic thinking (Artzt, Armour-Thomas, & Curcio, 2008)
Activities structured in ways allowing students to explore, explain, extend, and evaluate their progress (National Research Council, 1999)
There are three critical components to effective mathematics instruction (Shellard & Moyer, 2002):

- Teaching for conceptual understanding
- Developing children’s procedural literacy
- Promoting strategic competence through meaningful problem-solving investigations

Teachers should be:

- Demonstrating acceptance and recognition of students’ divergent ideas
- Challenging students to think deeply about the problems they are solving, extending thinking beyond the solutions and algorithms required to solve the problem
- Influencing learning by asking challenging and interesting questions to accelerate students’ innate inquisitiveness and foster them to examine concepts further
- Projecting a positive attitude about mathematics and about students’ ability to “do” mathematics

Students should be:

- Actively engaging in “doing” mathematics
- Solving challenging problems
- Investigating meaningful real-world problems
- Making interdisciplinary connections
- Developing an understanding of mathematical knowledge required to “do” mathematics and connect the language of mathematical ideas with numerical representations
- Sharing mathematical ideas, discussing mathematics with one another, refining and critiquing each other’s ideas and understandings
- Communicating in pairs, small group, or whole group presentations
- Using multiple representations to communicate mathematical ideas
- Using connections between pictures, oral language, written symbols, manipulative models, and real-world situations
- Using technological resources and other 21st century skills to support and enhance mathematical understanding
Mathematics is not a stagnate field of textbook problems; rather, it is a dynamic way of constructing meaning about the world around us, generating knowledge and understanding about the real world every day. Students should be metaphorically rolling up their sleeves and “doing mathematics” themselves, not watching others do mathematics for them or in front of them. (Protheroe, 2007)

Balanced Mathematics Instructional Model

Balanced math consists of three different learning opportunities; guided math, shared math, and independent math. Ensuring a balance of all three approaches will build conceptual understanding, problem solving, computational fluency, and procedural fluency. Building conceptual understanding is the focal point of developing mathematical proficiency. Students should frequently work on rigorous tasks, talk about the math, explain their thinking, justify their answer or process, build models with graphs or charts or manipulatives, and use technology.

When balanced math is used in the classroom it provides students opportunities to:

- solve problems
- make connections between math concepts and real-life situations
- communicate mathematical ideas (orally, visually and in writing)
- choose appropriate materials to solve problems
- reflect and monitor their own understanding of the math concepts
- practice strategies to build procedural and conceptual confidence

Teacher builds conceptual understanding by modeling through demonstration, explicit instruction, and think alouds, as well as guiding students as they practice math strategies and apply problem solving strategies. (whole group or small group instruction)

Teacher and students practice mathematics processes together through interactive activities, problem solving, and discussion. (whole group or small group instruction)

Students practice math strategies independently to build procedural and computational fluency. Teacher assesses learning and reteaches as necessary. (whole group instruction, small group instruction, or centers)

Educational Technology

Standards

➢ Technology Operations and Concepts
  • Construct a spreadsheet workbook with multiple worksheets, rename tabs to reflect the data on the worksheet, and use mathematical or logical functions, charts and data from all worksheets to convey the results.

  Example: Students will use appropriate digital tools and software to problem solve, check for accuracy and support answers.

➢ Digital Citizenship
  • Analyze the capabilities and limitations of current and emerging technology resources and assess their potential to address personal, social, lifelong learning and career needs.

  Example: Students will be able to use critical thinking skills to plan, conduct, research, manage projects, solve problems, and make informed decisions using appropriate digital tools and resource.

➢ Research and Information Literacy
  • Produce a position statement about a real world problem by developing a systematic plan of investigation with peers and experts synthesizing information from multiple sources.

  Example: Students will produce a position statement about a real world problem by developing a systematic plan of investigation with peers and experts synthesizing information from multiple sources.

➢ Design: Critical Thinking, Problem Solving, and Decision Making
  • Evaluate the strengths and limitations of emerging technologies and their impact on educational, career, personal and or social needs.

  Example: A problem-solving approach will allow students to construct their own idea about mathematics and to take responsibility for their own learning.
Career Ready Practices

Career Ready Practices describe the career-ready skills that all educators in all content areas should seek to develop in their students. They are practices that have been linked to increase college, career, and life success. Career Ready Practices should be taught and reinforced in all career exploration and preparation programs with increasingly higher levels of complexity and expectation as a student advances through a program of study.

- **CRP2. Apply appropriate academic and technical skills.**
  Career-ready individuals readily access and use the knowledge and skills acquired through experience and education to be more productive. They make connections between abstract concepts with real-world applications, and they make correct insights about when it is appropriate to apply the use of an academic skill in a workplace situation.
  **Example:** Students are able to apply concepts in the classroom to solve real life application problems and analyzing their solutions for accuracy.

- **CRP4. Communicate clearly and effectively and with reason.**
  Career-ready individuals communicate thoughts, ideas, and action plans with clarity, whether using written, verbal, and/or visual methods. They communicate in the workplace with clarity and purpose to make maximum use of their own and others’ time. They are excellent writers; they master conventions, word choice, and organization, and use effective tone and presentation skills to articulate ideas. They are skilled at interacting with others; they are active listeners and speak clearly and with purpose. Career-ready individuals think about the audience for their communication and prepare accordingly to ensure the desired outcome.
  **Example:** Students are able to listen, communicate and have constructed arguments to justify their approach and conclusion to a problem.

- **CRP8. Utilize critical thinking to make sense of problems and persevere in solving them.**
  Career-ready individuals readily recognize problems in the workplace, understand the nature of the problem, and devise effective plans to solve the problem. They are aware of problems when they occur and take action quickly to address the problem; they thoughtfully investigate the root cause of the problem prior to introducing solutions. They carefully consider the options to solve the problem. Once a solution is agreed upon, they follow through to ensure the problem is solved, whether through their own actions or the actions of others.
  **Example:** Students are able to utilized concepts learnt in the classroom to analyze problems, create a plan to solve the problem, solve the problem and check their solution for correctness.

- **CRP11. Use technology to enhance productivity.**
  Career-ready individuals find and maximize the productive value of existing and new technology to accomplish workplace tasks and solve workplace problems. They are flexible and adaptive in acquiring new technology. They are proficient with ubiquitous technology applications. They understand the inherent risks-personal and organizational-of technology applications, and they take actions to prevent or mitigate these risks.
  **Example:** Students are able to use a variety of technology such as the TI-84 and online resources to effectively to help in problem solving.
### WIDA Proficiency Levels

At the given level of English language proficiency, English language learners will process, understand, produce or use:

<table>
<thead>
<tr>
<th>Level</th>
<th>Language Proficiency</th>
</tr>
</thead>
</table>
| **6- Reaching** | • Specialized or technical language reflective of the content areas at grade level  
                   • A variety of sentence lengths of varying linguistic complexity in extended oral or written discourse as required by the specified grade level  
                   • Oral or written communication in English comparable to proficient English peers |
| **5- Bridging** | • Specialized or technical language of the content areas  
                   • A variety of sentence lengths of varying linguistic complexity in extended oral or written discourse, including stories, essays or reports  
                   • Oral or written language approaching comparability to that of proficient English peers when presented with grade level material. |
| **4- Expanding** | • Specific and some technical language of the content areas  
                   • A variety of sentence lengths of varying linguistic complexity in oral discourse or multiple, related sentences or paragraphs  
                   • Oral or written language with minimal phonological, syntactic or semantic errors that may impede the communication, but retain much of its meaning, when presented with oral or written connected discourse, with sensory, graphic or interactive support |
| **3- Developing** | • General and some specific language of the content areas  
                   • Expanded sentences in oral interaction or written paragraphs  
                   • Oral or written language with phonological, syntactic or semantic errors that may impede the communication, but retain much of its meaning, when presented with oral or written, narrative or expository descriptions with sensory, graphic or interactive support |
| **2- Beginning** | • General language related to the content area  
                   • Phrases or short sentences  
                   • Oral or written language with phonological, syntactic, or semantic errors that often impede of the communication when presented with one to multiple-step commands, directions, or a series of statements with sensory, graphic or interactive support |
| **1- Entering** | • Pictorial or graphic representation of the language of the content areas  
                   • Words, phrases or chunks of language when presented with one-step commands directions, WH-, choice or yes/no questions, or statements with sensory, graphic or interactive support |
### Language Development Supports For English Language Learners
To Increase Comprehension and Communication Skills

#### Environment
- Welcoming and stress-free
- Respectful of linguistic and cultural diversity
- Honors students' background knowledge
- Sets clear and high expectations
- Includes routines and norms
- Is thinking-focused vs. answer-seeking
- Offers multiple modalities to engage in content learning and to demonstrate understanding
- Includes explicit instruction of specific language targets
- Provides participation techniques to include all learners
- Integrates learning centers and games in a meaningful way
- Provides opportunities to practice and refine receptive and productive skills in English as a new language
- Integrates meaning and purposeful tasks/activities that:
  - Are accessible by all students through multiple entry points
  - Are relevant to students’ lives and cultural experiences
  - Build on prior mathematical learning
  - Demonstrate high cognitive demand
  - Offer multiple strategies for solutions
  - Allow for a language learning experience in addition to content

#### Sensory Supports*
- Real-life objects (realia) or concrete objects
- Physical models
- Manipulatives
- Pictures & photographs
- Visual representations or models such as diagrams or drawings
- Videos & films
- Newspapers or magazines
- Gestures
- Physical movements
- Music & songs

#### Graphic Supports*
- Graphs
- Charts
- Timelines
- Number lines
- Graphic organizers
- Graphing paper

#### Interactive Supports*
- In a whole group
- In a small group
- With a partner such as Turn-and-Talk
- In pairs as a group (first, two pairs work independently, then they form a group of four)
- In triads
- Cooperative learning structures such as Think-Pair-Share
- Interactive websites or software
- With a mentor or coach

#### Verbal and Textual Supports
- Labeling
- Students’ native language
- Modeling
- Repetitions
- Paraphrasing
- Summarizing
- Guiding questions
- Clarifying questions
- Probing questions
- Leveled questions such as What? Where? When? How? Why?
- Questioning prompts & cues
- Word Banks
- Sentence starters
- Sentence frames
- Discussion frames
- Talk moves, including Wait Time

---

BUILDING EQUITY IN YOUR TEACHING PRACTICE

How do the essential questions highlight the connection between the big ideas of the unit and equity in your teaching practice?

**CONTENT INTEGRATION**
Teachers use examples and content from a variety of cultures & groups.

This unit / lesson is connected to other topics explored with students.

There are multiple viewpoints reflected in the content of this unit / lesson.

The materials and resources are reflective of the diverse identities and experiences of students.

The content affirms students, as well as exposes them to experiences other than their own.

**KNOWLEDGE CONSTRUCTION**
Teachers help students understand how knowledge is created and influenced by cultural assumptions, perspectives & biases.

This unit / lesson provides context to the history of privilege and oppression.

This unit / lesson addresses power relationships.

This unit / lesson help students to develop research and critical thinking skills.

This curriculum creates windows and mirrors for students.

**PREJUDICE REDUCTION**
Teachers implement lessons and activities to assert positive images of ethnic groups & improve intergroup relations.

This unit / lesson help students question and unpack biases & stereotypes.

This unit / lesson help students examine, research and question information and sources.

The curriculum encourage discussion and understanding about the groups of people being represented.

This unit / lesson challenges dominant perspectives.

**EQUITABLE PEDAGOGY**
Teachers modify techniques and methods to facilitate the academic achievement of students from diverse backgrounds.

The instruction has been modified to meet the needs of each student.

Students feel respected and their cultural identities are valued.

Additional supports have been provided for students to become successful and independent learners.

Opportunities are provided for student to reflect on their learning and provide feedback.

**EMPOWERING SCHOOL CULTURE**
Using the other four dimensions to create a safe and healthy educational environment for all.

There are opportunities for students to connect with the community.

My classroom is welcoming and supportive for all students?

I am aware of and sensitive to the needs of my students and their families.

There are effective parent communication systems established. Parents can talk to me about issues as they arise in my classroom.

# Culturally Relevant Pedagogy Examples

- **Present New Concepts Using Student Vocabulary:** Use student diction to capture attention and build understanding before using academic terms.
  
  **Example:** Work with students to create a variety of sorting and match games of vocabulary words in this unit. Students can work in teams or individually to play these games for approximately 10-15 minutes each week. This will give students a different way of becoming familiar with the vocabulary rather than just looking up the words or writing the definition down.

- **Use Media that Positively Depict a Range of Culture:** Include different cultures and languages in your curriculum by presenting relevant material, such as movies, about them.
  
  **Example:** Use multiple approach such as an online component that can be shared with students and parents. Work as a facilitator and set a timeline for students to accomplish task.
  
  [https://quizlet.com/subject/integrals/](https://quizlet.com/subject/integrals/)

- **Call on Each Student:** Encourage each student to share his or her thoughts through call-and-response, keeping the class’s attention in the process.
  
  **Example:** Foster confidence. Make the assessment process less intimidating by offering different ways to demonstrate skills and understanding. For example, avoid handing out quizzes that are purely multiple choice or fill-in-the-blank. Among other question types, mix in problems that involve explaining the step necessary to get to the answer. After, give students time to assess their own progress and performance, helping them focus on growth.

- **Encourage Students to Propose Ideas for Projects:** Let students take projects from concept to completion by pitching you idea, allowing them to showcase their strengths.
  
  **Example:** Students will take accountability to develop project ideas that meet academic standards. You will act as a coach to guide students that falls short to refine their ideas, if he/or she can’t refine their ideas to meet the standards they can choose from a project list of options you provide.
  
### Differentiated Instruction

### Differentiated Instruction

**Accommodate Based on Content Needs: Strategies**

- Anchor charts to model strategies
- Review Algebra concepts to ensure students have the information needed to progress in understanding
- Pre-teach pertinent vocabulary
- Provide reference sheets that list formulas, step-by-step procedures, theorems, and modeling of strategies
- Word wall with visual representations of mathematical terms
- Teacher modeling of thinking processes involved in solving, graphing, and writing equations
- Introduce concepts embedded in real-life context to help students relate to the mathematics involved
- Record formulas, processes, and mathematical rules in reference notebooks
- Graphing calculator to assist with computations and graphing of trigonometric functions
- Utilize technology through interactive sites to represent nonlinear data
- Graphic organizers to help students interpret the meaning of terms in an expression or equation in context
- Translation dictionary
- Sentence stems to provide additional language support for ELL students.

## Enrichment

**What is the purpose of Enrichment?**

- The purpose of enrichment is to provide extended learning opportunities and challenges to students who have already mastered, or can quickly master, the basic curriculum. Enrichment gives the student more time to study concepts with greater depth, breadth, and complexity.
- Enrichment also provides opportunities for students to pursue learning in their own areas of interest and strengths.
- Enrichment keeps advanced students engaged and supports their accelerated academic needs.
- Enrichment provides the most appropriate answer to the question, “What do you do when the student already knows it?”

<table>
<thead>
<tr>

Assessments

**Required District/State Assessments**
SGO Assessments

**Suggested Formative/Summative Classroom Assessments**
- Describe Learning Vertically
- Identify Key Building Blocks
- Make Connections (between and among key building blocks)
- Short/Extended Constructed Response Items
- Multiple-Choice Items (where multiple answer choices may be correct)
- Drag and Drop Items
- Use of Equation Editor
- Quizzes
- Journal Entries/Reflections/Quick-Writes
- Accountable talk
- Projects
- Portfolio
- Observation
- Graphic Organizers/Concept Mapping
- Presentations
- Role Playing
- Teacher-Student and Student-Student Conferencing
- Homework
# New Jersey Student Learning Standards (NJSLS)

**F-IF.A.1** Understand that a function from one set (called the domain) to another set (called the range) assigns to each element of the domain exactly one element of the range. If \( f \) is a function and \( x \) is an element of its domain, then \( f(x) \) denotes the output of \( f \) corresponding to the input \( x \). The graph of \( f \) is the graph of the equation \( y = f(x) \).

**F-IF.A.2** Use function notation, evaluate functions for inputs in their domains, and interpret statements that use function notation in terms of a context.

**F-TF.A.3** Use special triangles to determine geometrically the values of sine, cosine, tangent for \( \pi/3, \pi/4 \) and \( \pi/6 \), and use the unit circle to express the values of sine, cosines, and tangent for \( \pi-x, \pi+x, \) and \( 2\pi-x \) in terms of their values for \( x \), where \( x \) is any real number.

**F.IF.C.9** Compare properties of two functions each represented in a different way (algebraically, graphically, numerically in tables, or by verbal descriptions).

**F.BF.A.1** Write a function that describes a relationship between two quantities.

**F.BF.A.2** Write arithmetic and geometric sequences both recursively and with an explicit formula, use them to model situations, and translate between the two forms.

**G.GMD.B.4** Identify the shapes of two-dimensional cross-sections of three-dimensional objects, and identify three-dimensional objects generated by rotations of two-dimensional objects.

**G.C.B.5** Derive using similarity the fact that the length of the arc intercepted by an angle is proportional to the radius, and define the radian measure of the angle as the constant of proportionality; derive the formula for the area of a sector.
# Mathematical Practices for AP Calculus (by the College Board)

## MPAC 1: Reasoning with definitions and theorems
Students can:
- Use definitions and theorems to build arguments, to justify conclusions or answers, and to prove results;
- Confirm that hypotheses have been satisfied in order to apply the conclusion of a theorem;
- Apply definitions and theorems in the process of solving a problem;
- Interpret quantifiers in definitions and theorems (e.g., “for all,” “there exists”);
- Develop conjectures based on exploration with technology;
- Produce examples and counterexamples to clarify understanding of definitions, to investigate whether converses of theorems are true or false, or to test conjectures.

## MPAC 2: Connecting concepts
Students can:
- Relate the concept of a limit to all aspects of calculus;
- Use the connection between concepts (e.g., rate of change and accumulation) or processes (e.g., differentiation and its inverse process, anti-differentiation) to solve problems;
- Connect concepts to their visual representations with and without technology; and
- Identify a common underlying structure in problems involving different contextual situations.

## MPAC 3: Implementing algebraic/computational processes
Students can:
- Select appropriate mathematical strategies;
- Sequence algebraic/computational procedures logically;
- Complete algebraic/computational processes correctly;
- Apply technology strategically to solve problems;
- Attend to precision graphically, numerically, analytically, and verbally and specify units of measure; and
- Connect the results of algebraic/computational processes to the question asked.
MPAC 4: Connecting multiple representations

Students can:
- Associate tables, graphs, and symbolic representations of functions;
- Develop concepts using graphical, symbolical, verbal, or numerical representations with and without technology;
- Identify how mathematical characteristics of functions are related in different representations;
- Extract and interpret mathematical content from any presentation of a function (e.g., utilize information from a table of values);
- Construct one representational form from another (e.g., a table from a graph or a graph from given information); and
- Consider multiple representations (graphical, numerical, analytical, and verbal) of a function to select or construct a useful representation for solving a problem.

MPAC 5: Building notational fluency

Students can:
- Know and use a variety of notations
- Connect notation to definitions (e.g., relating the notation for the definite integral to that of the limit of a Riemann sum);
- Connect notation to different representations (graphical, numerical, analytical, and verbal); and
- Assign meaning to notation, accurately interpreting the notation in a given problem and across different contexts.

MPAC 6: Communicating

Students can:
- Clearly present methods, reasoning, justifications, and conclusions;
- Use accurate and precise language and notation;
- Explain the meaning of expressions, notation, and results in terms of a context (including units);
- Explain the connections among concepts;
- Critically interpret and accurately report information provided by technology; and
- Analyze, evaluate, and compare the reasoning of others.
Grade: 12th  
Unit: 4 (Four)  
Topic: Definite Integrals & Differential Equations

**Unit 4 NJSLS:** F-IF.A.1, F-IF.A.2, F-IF.A.3, F-IF.C.9, G.C.B.5, G.GMD.B.4, G.MG.A.3

**Student Learning Objective (SLO 1):**
- Approximate the area under the graph of nonnegative continuous functions by using rectangle approximation method.
- Interpret the area under the graph as a net accumulation of rate of change.
- Express the area under the curve as a definite integral and as a limit of Riemann Sum.
- Compute the area under a curve using a numerical integration procedure.
- Apply rules of definite integrals and find the average value of a function over a closed interval.

**New Jersey Student Learning Standards (NJSLS):**

**F-IF.A.1:** Understand that a function from one set (called the domain) to another set (called the range) assigns to each element of the domain exactly one element of the range. If \( f \) is a function and \( x \) is an element of its domain, then \( f(x) \) denotes the output of \( f \) corresponding to the input \( x \). The graph of \( f \) is the graph of the equation \( y = f(x) \).

**F.IF.A.2:** Use function notation, evaluate functions for inputs in their domains, and interpret statements that use function notation in terms of a context.

**F.IF.A.3:** Recognize that sequences are functions, sometimes defined recursively, whose domain is a subset of the integers. For example, the Fibonacci sequence is defined recursively by \( f(0) = f(1) = 1, f(n+1) = f(n) + f(n-1) \) for \( n \geq 1 \).

**F.IF.C.9:** Compare properties of two functions each represented in a different way (algebraically, graphically, numerically in tables, or by verbal descriptions).

Use Euler’s Method for graphing a solution to an initial value problem.

Construct antiderivatives using the Fundamental Theorem of Calculus.

One way to begin this lesson is let $f(x) = cx$ and $F(x) = cx$ and observe that $F(x) = \int_0^c c \, dt = \int_0^x f(x) \, dt$ and $F'(x) = f(x)$. A simple example like this can help students to become comfortable with a function definition in the form $F(x) = \int_a^x f(t) \, dt$ and can help to make the Fundamental Theorem of Calculus easier to understand.

|  | Common error- Algebraic mistake are very common in evaluating antiderivatives. |

the key to solving many problems.

The Fundamental Theorem of Calculus, which has two distinct formulations, connects differentiation and integration.

Definite integrals can be approximated using a left Riemann sum, a right Riemann sum, midpoint Riemann sum, or a trapezoidal sum; approximations can be computed using either uniform or non-uniform partitions.

It is important that students understand that the solution to a differential equation given an initial condition is a function.

Marking Period 4 – Suggested Project

* Projects beginnings at the start of the marking period and finishes at the end.

For your final grade this year, you will have two options to choose from. This will count as a test grade. The project will consist of 2 parts. For part I, you will create a video. For part II you must create an art piece. Each part is 50% of the project grade. Projects have a limit of 4 class members for the video, and two members for the art piece, all of which must be in the same class period. You also may work individually or with a partner.

**Part I**

Create a math video, music video, or skit on a Calculus topic. The video must be at least 4 minutes long.

**Part II - Art Piece**

There are two requirements for the art project: an art piece and a museum appropriate, information tag including a summary of the art you created, how it incorporates your topic, and what you intend viewers to think about when they see the art. You may pick your own topic, but must get topic and proposal approved. Make sure your art shows your understanding of the calculus topic. On the due date, you are to turn in the actual artwork and a printout of the information tag.

* See MP4 Project folder for full project and rubric.
AP Calculus Test Preparation Strategies

- The exam is 3 hours and 15 minutes long and has two sections — multiple choice and free-response. A graphing calculator is required for parts of the exam (see below). You may not take both the Calculus AB and Calculus BC exams within the same year.

- **Section I: Multiple Choice** | 45 Questions | 1 hour and 45 minutes | 50% of Final Exam Score
  - Part A — 30 questions | 60 minutes (calculator not permitted)
  - Part B — 15 questions | 45 minutes (graphing calculator required)

- **Section II: Free-Response** | 6 Questions | 1 hour and 30 minutes | 50% of Final Exam Score
  - Part A — 2 problems | 30 minutes (graphing calculator required)
  - Part B — 4 problems | 60 minutes (calculator not permitted)

**Completing Section II: Free-Response Questions**

- During the second timed portion of the free-response section (Part B), you are permitted to continue work on problems in Part A, but you are not permitted to use a calculator during this time. For more information, see this course’s calculator policy and the list of approved graphing calculators.

- As you begin each part of Section II, you may wish to look over the questions before starting to work on them. It is not expected that everyone will be able to complete all parts of all questions.

- Show all of your work, even though a question may not explicitly remind you to do so. Clearly label any functions, graphs, tables, or other objects that you use. Justifications require that you give mathematical reasons, and that you verify the needed conditions under which relevant theorems, properties, definitions, or tests are applied. Your work will be scored on the correctness and completeness of your methods as well as your answers. Answers without supporting work will usually not receive credit.

- Your work must be expressed in standard mathematical notation rather than calculator syntax. For example, \( \int_{1}^{5} x^2 \, dx \) may not be written as \( \text{fnInt}(X^2, X, 1, 5) \).

- Unless otherwise specified, answers (numeric or algebraic) need not be simplified. If you use decimal approximations in calculations, your work will be scored on accuracy. Unless otherwise specified, your final answers should be accurate to three places after the decimal point.

- Unless otherwise specified, the domain of a function \( f \) is assumed to be the set of all real numbers \( x \) for which \( f(x) \) is a real number.
AP Calculus Test Preparation Strategies

Keep an eye on your time.
Monitor your time carefully. Make sure not to spend too much time on any one question so you’ll have enough time to answer all of them. If you do work that you think is incorrect, simply put an “X” through it instead of spending time erasing it completely: crossed-out work won’t be graded.

Show your work, even when you’re using a calculator.
Show all the steps you took to reach your solution on questions involving calculations. The exam reader wants to see if you know how to solve the problem. If you use your calculator to solve an equation, compute a numerical derivative, or find a definite integral, then be sure to write the equation, derivative, or integral first: an answer without this information might not get full credit, even if the answer is correct. Remember to write your work in standard notation (e.g. \( \int_1^6 x^2 \, dx \)) rather than calculator syntax (e.g. fnInt(X^2,X,1,5), as calculator syntax is not acceptable.

Try to solve each part of the question.
Many free-response questions are divided into parts such as (a), (b), (c), and (d), with each part calling for a different response. Credit for each part is awarded independently, so you should attempt to solve each part. For example, you may receive no credit for your answer to part (a), but still receive full credit for part (b), (c), or (d). If the answer to a later part of a question depends on the answer to an earlier part, you may still be able to receive full credit for the later part, even if that earlier answer is wrong.

Be sure to fully answer the question being asked.
For example, if a question asks for the maximum value of a function, do not stop after finding the x-value at which the maximum value occurs. Be sure to express your answer in correct units if units are given and always provide a justification when it is asked for.

When asked to justify or to explain an answer, think about how that can be done.
For example, if you are asked to justify a point of inflection, you need to show that the sign of the second derivative changes. Simply saying that the second derivative equals zero or is undefined is not a justification.

Do not round partial answers.
Store partial answers in your calculator so that you can use them unrounded in further calculations.

Practice!
Answering free-response questions from previous AP Exams is a great way to practice: it allows you to compare your own responses with those that have already been evaluated and scored. Free-response questions and scoring guidelines are available on the Exam Practice page for AP Calculus AB.
